

BMD ENG 301 Quantitative Systems Physiology (Nervous System)

Lecture 11: Neurotransmitters

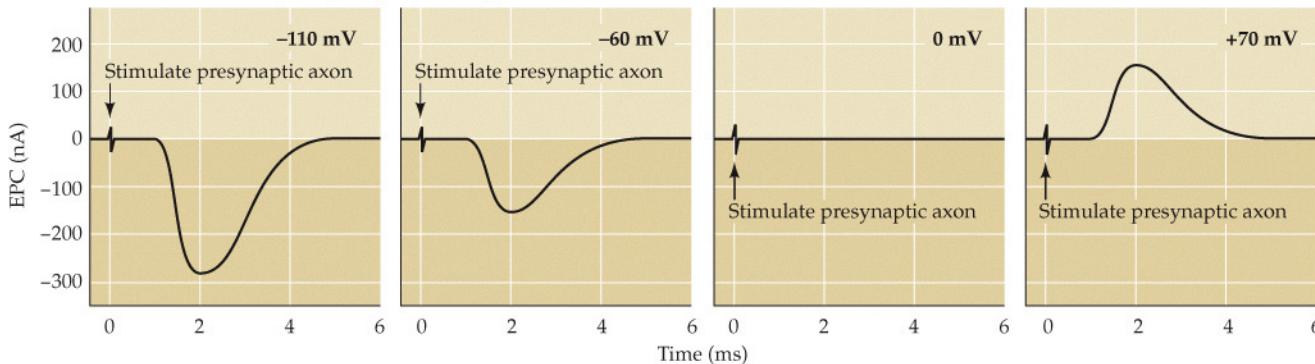

Professor Malcolm A. MacIver

Influence of the postsynaptic membrane potential on end plate currents

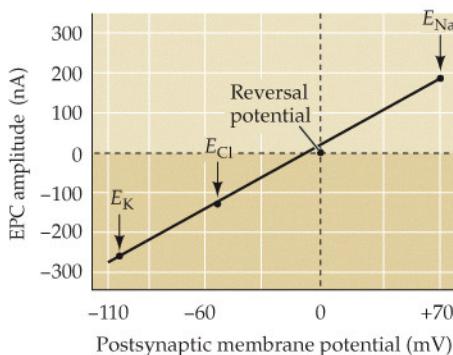

(A) Scheme for voltage clamping postsynaptic muscle fiber

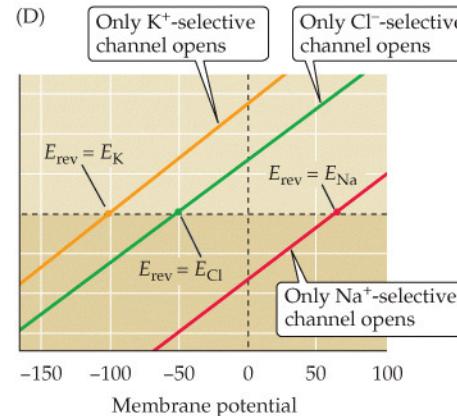

(B) Effect of membrane voltage on postsynaptic end plate currents (EPCs)

(C)

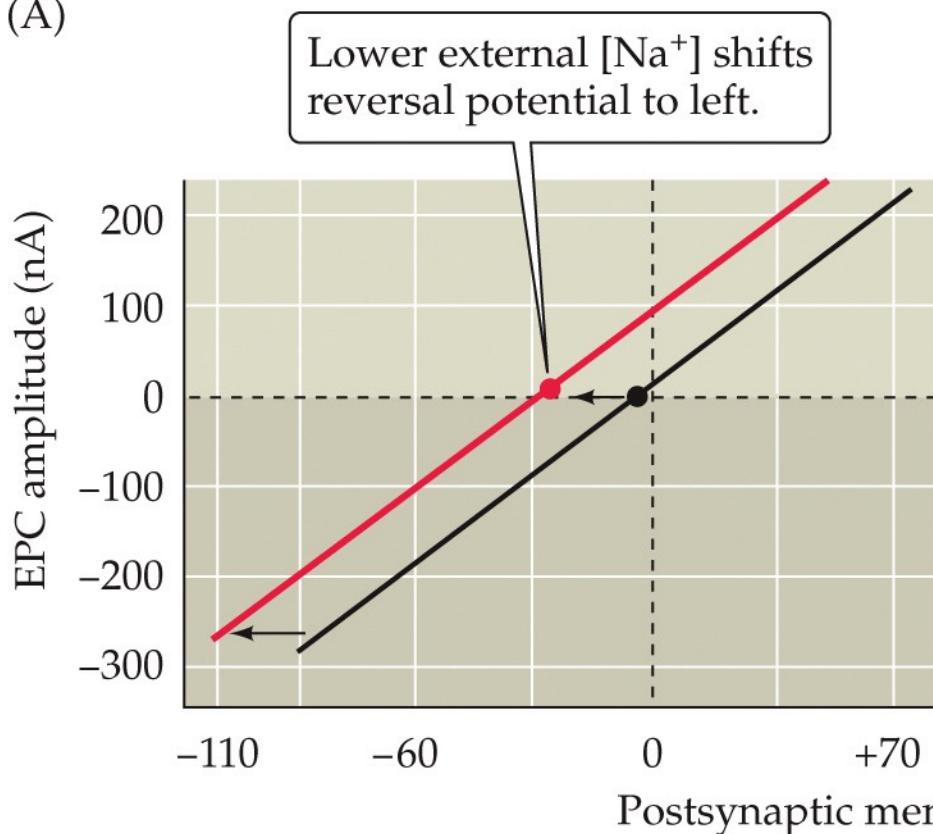

(D)

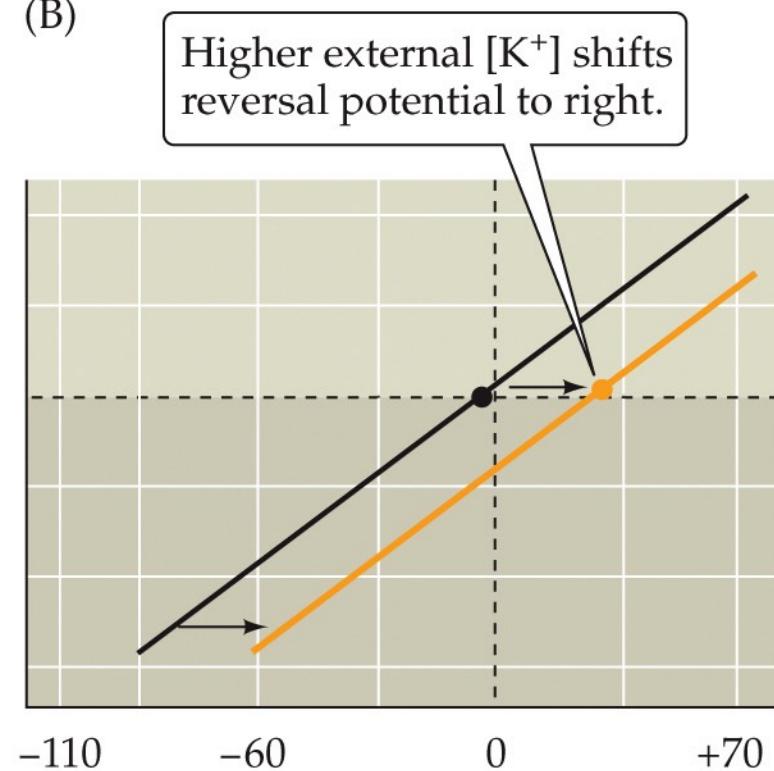

After Takeuchi and Takeuchi (1960). *J. Physiol.* 154: 52–67.

Reversal potential of the end plate current changes when ion gradients change

(A)

(B)

After Takeuchi and Takeuchi (1960) *J. Physiol.* 154: 52–67.

Examples of small-molecule and peptide neurotransmitters

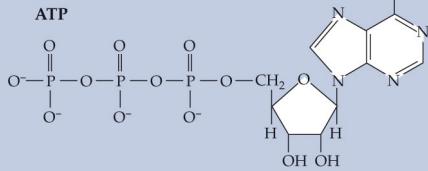

SMALL-MOLECULE NEUROTRANSMITTERS

AMINO ACIDS

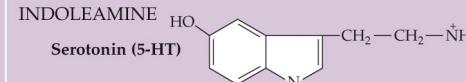

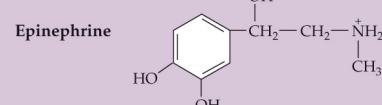

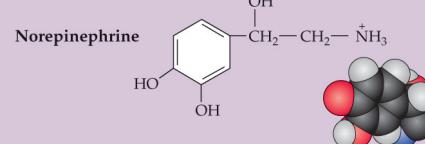

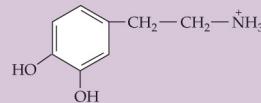

PURINES

BIOGENIC AMINES

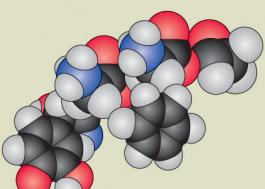

CATECHOLAMINES

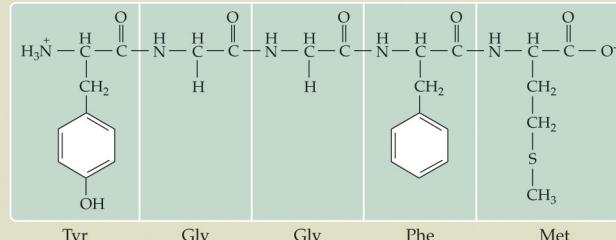

IMIDAZOLEAMINE

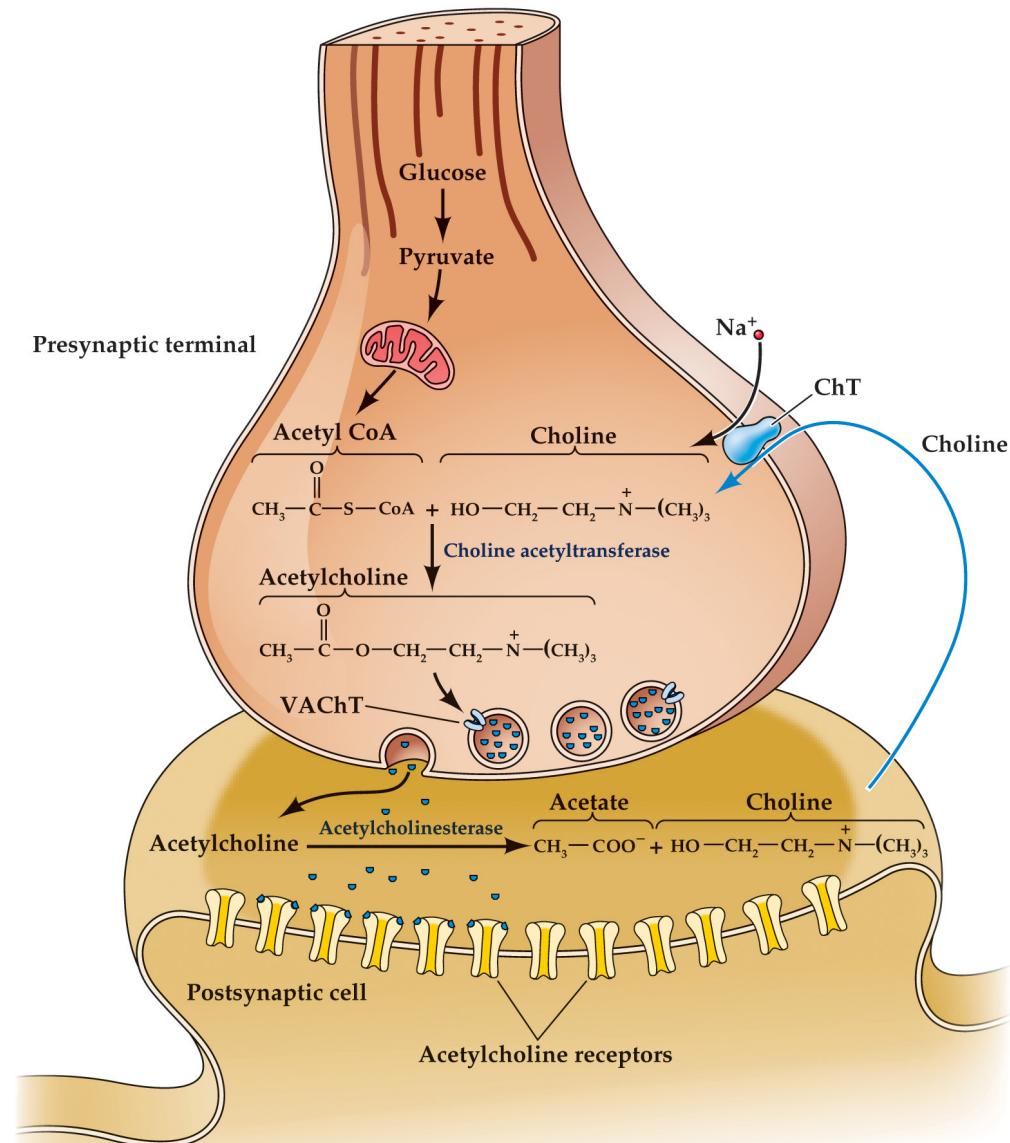

PEPTIDE NEUROTRANSMITTERS (more than 100 peptides, usually 3–36 amino acids long)

Example: Methionine enkephalin (Tyr–Gly–Gly–Phe–Met)

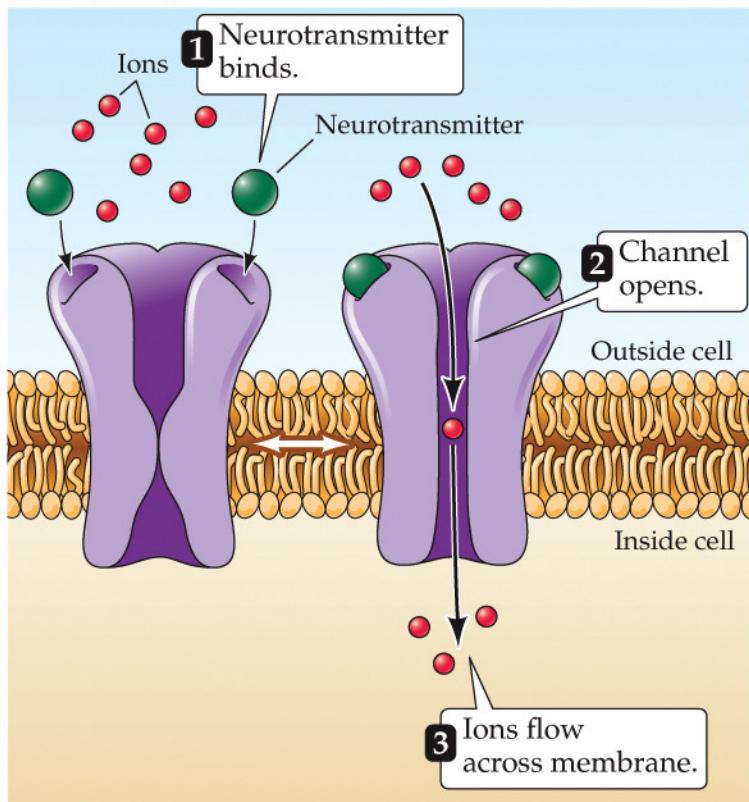

Acetylcholine metabolism in cholinergic nerve terminals

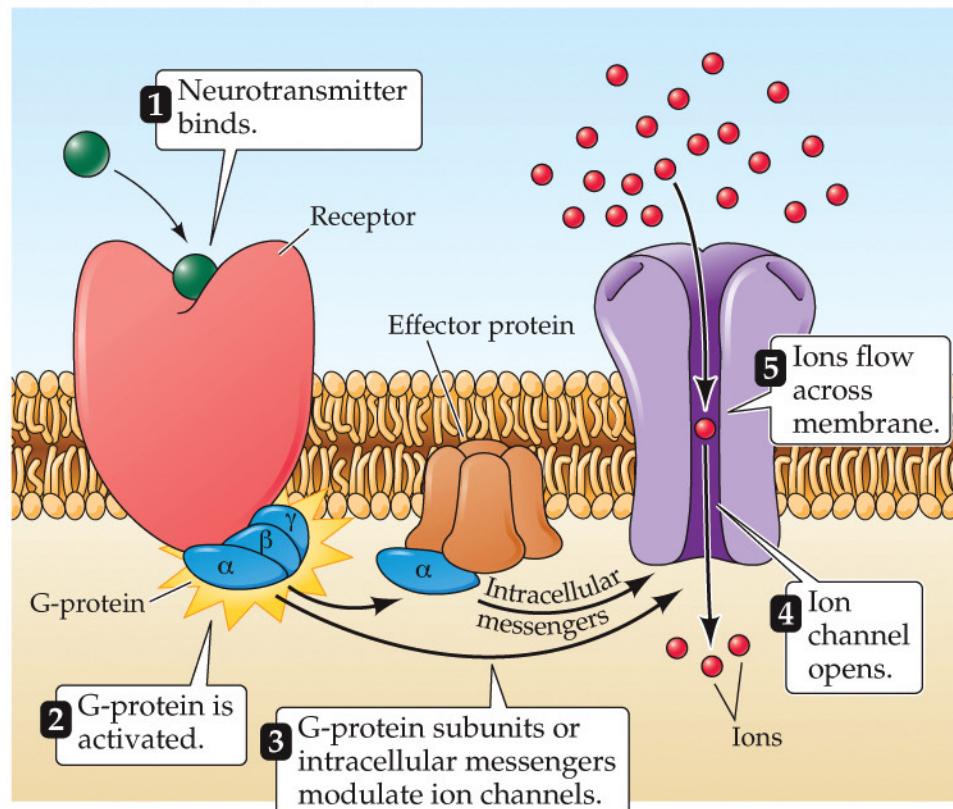

Two different types of neurotransmitter receptors

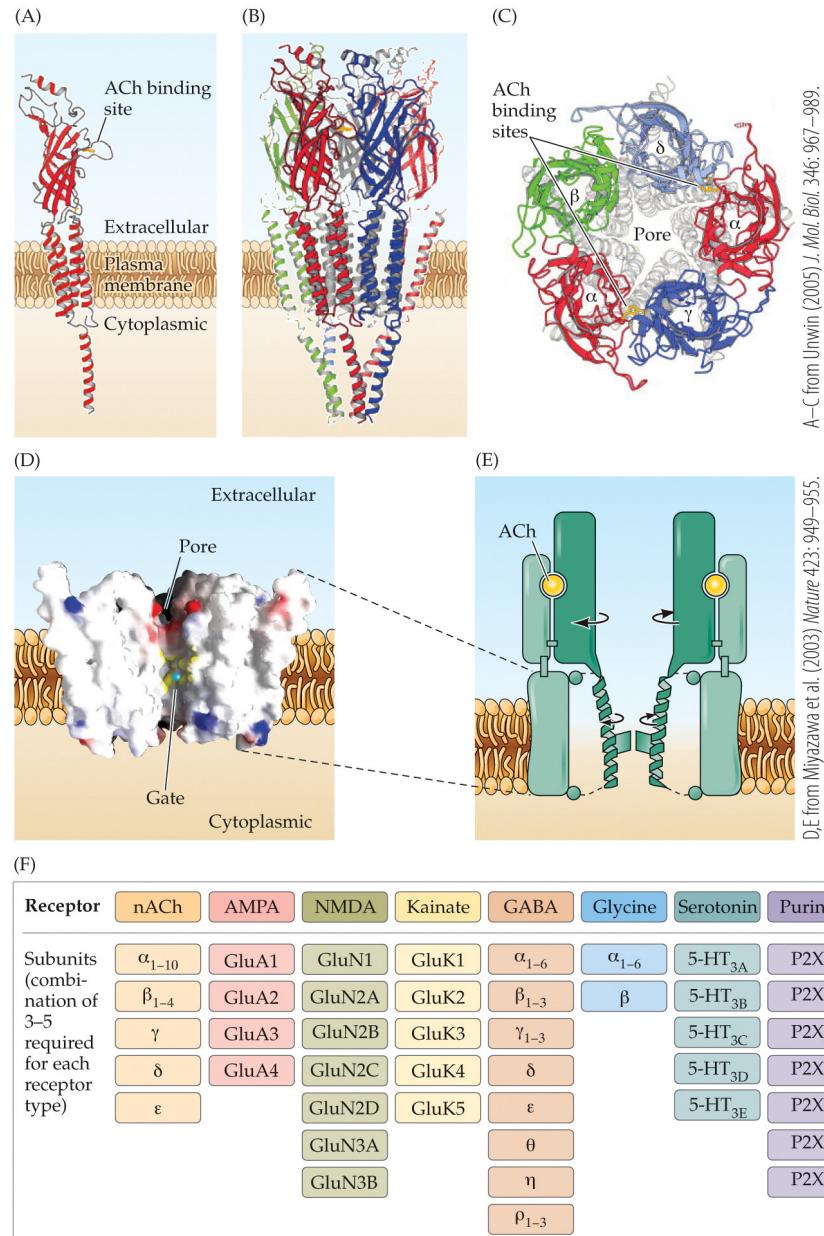

(A) Ligand-gated ion channels

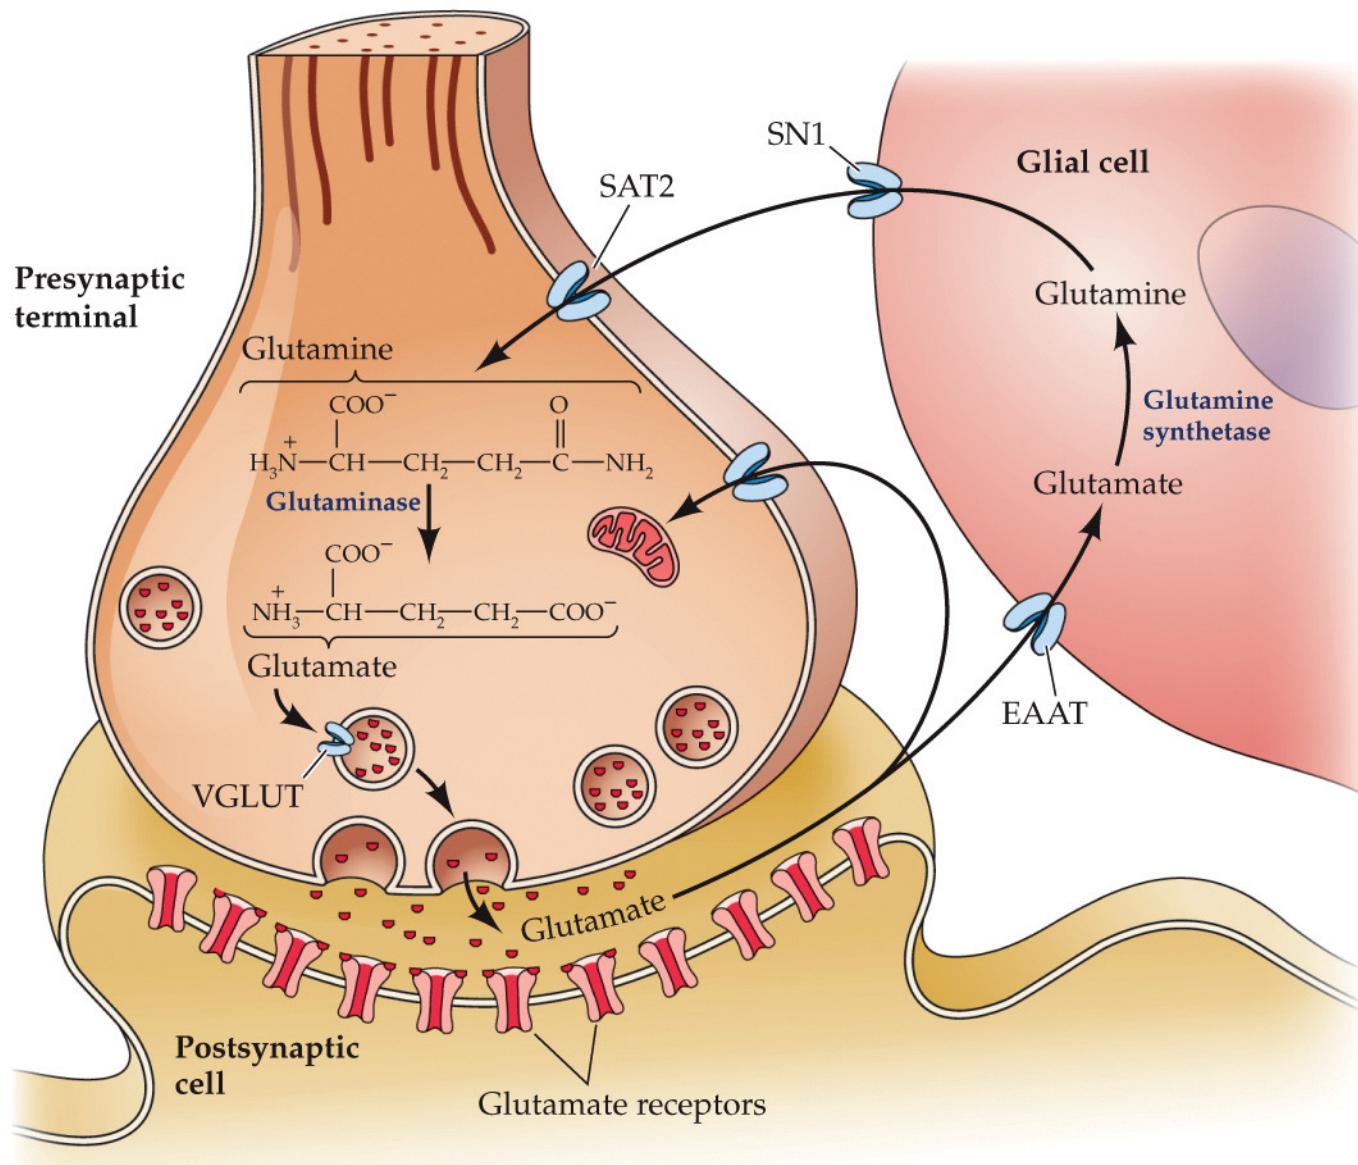

(B) G-protein-coupled receptors

Structure of the nicotinic ACh receptor

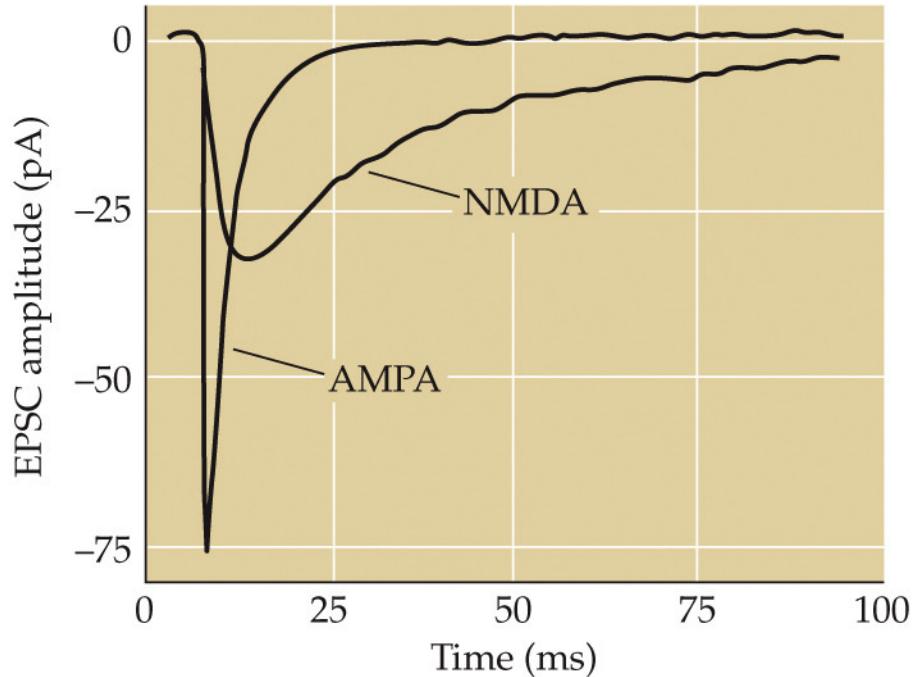

Glutamate synthesis and cycling between neurons and glia

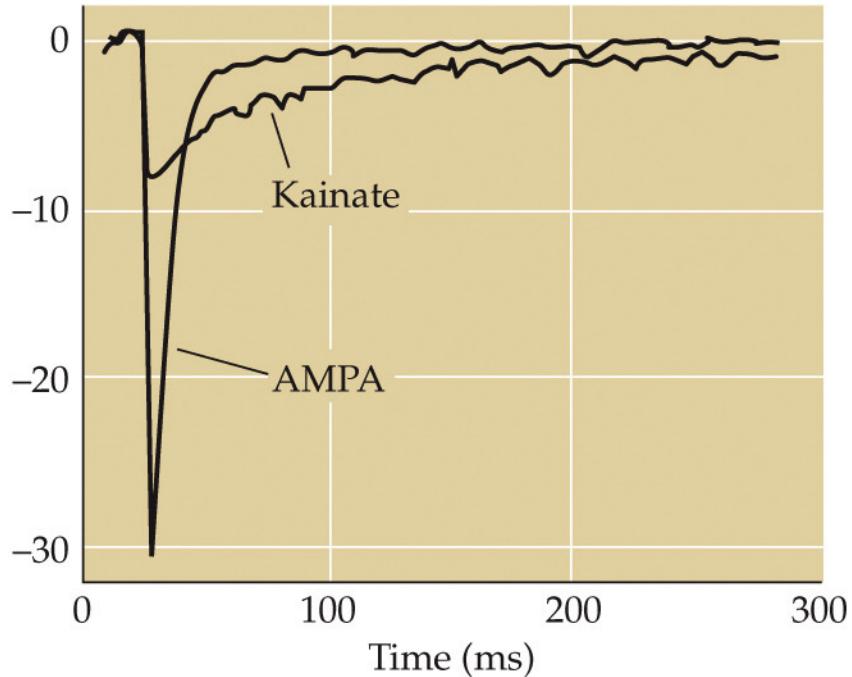

Postsynaptic responses mediated by ionotropic glutamate receptors

(A)

(B)

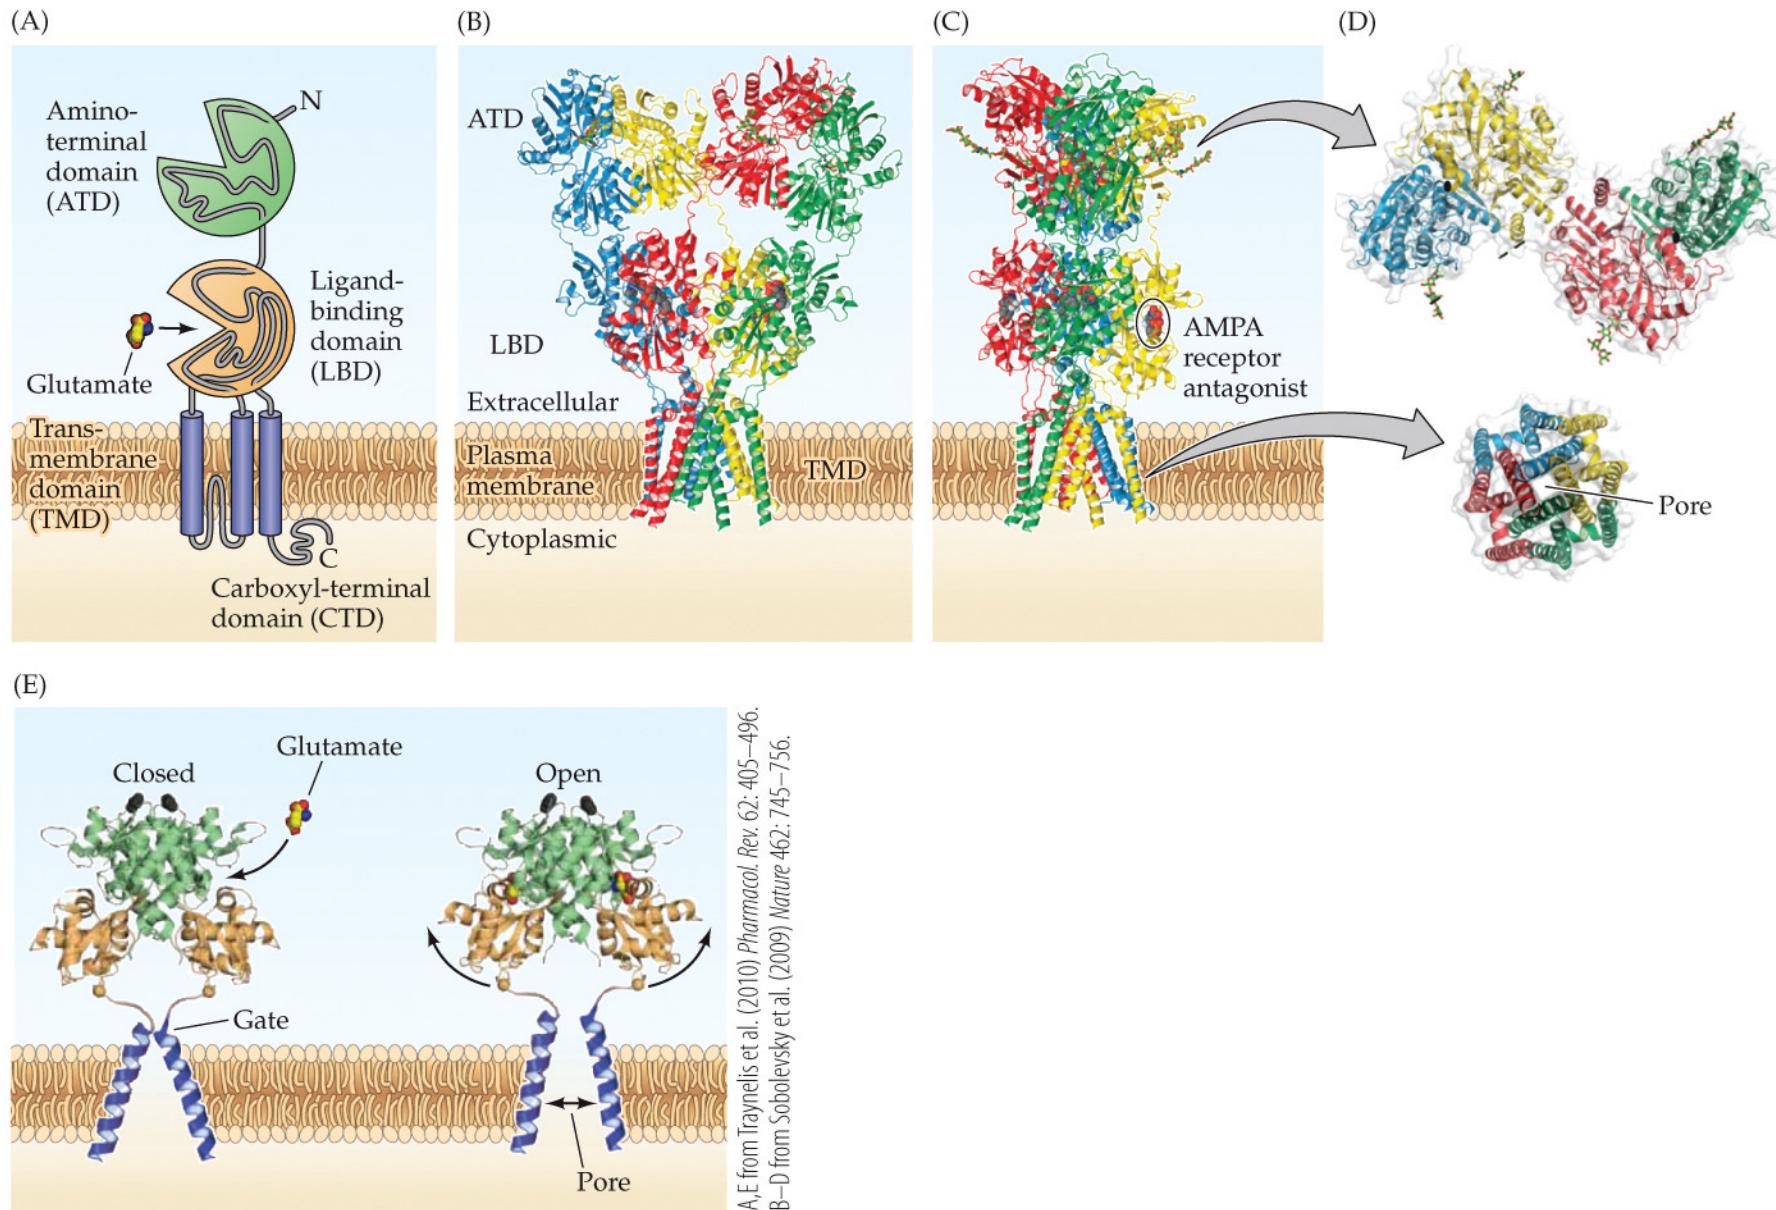

A after Watanabe et al. (2005) *J. Neurosci.* 25: 1024–1033. B from Mott et al. (2008) *J. Neurosci.* 28: 1659–1671.

Chap 5, p.89:

Formal criteria have been established to definitively identify a substance as a neurotransmitter. These criteria have led to the identification of more than 100 different neurotransmitters, which can be classified into two broad categories: small-molecule neurotransmitters, such as ACh, and neuropeptides (see Chapter 6). Having more than one transmitter diversifies the physiological repertoire of synapses. Multiple neurotransmitters can produce different types of responses on individual postsynaptic cells. For example, a neuron can be excited by one type of neurotransmitter and inhibited by another type of neurotransmitter. The speed of postsynaptic responses produced by different transmitters also differs, allowing control of electrical signaling over different timescales. In general, small-molecule neurotransmitters mediate rapid synaptic actions, whereas neuropeptides tend to modulate slower, ongoing neuronal functions. In some cases, neurons synthesize and release two or more different neurotransmitters; in this case, the molecules are called **co-transmitters**. Co-transmitters can be differentially released according to the pattern of synaptic activity, so that the signaling properties of such synapses change dynamically according to the rate of activity.

Amino acid sequences of neuropeptides

(A) Brain-gut peptides

(B) Opioid peptides

Amino acid properties

- Hydrophobic
- Polar, uncharged
- Acidic
- Basic

(C) Pituitary peptides

(D) Hypothalamic-releasing peptides

(E) Miscellaneous peptides

Endogenous Opioid Peptides

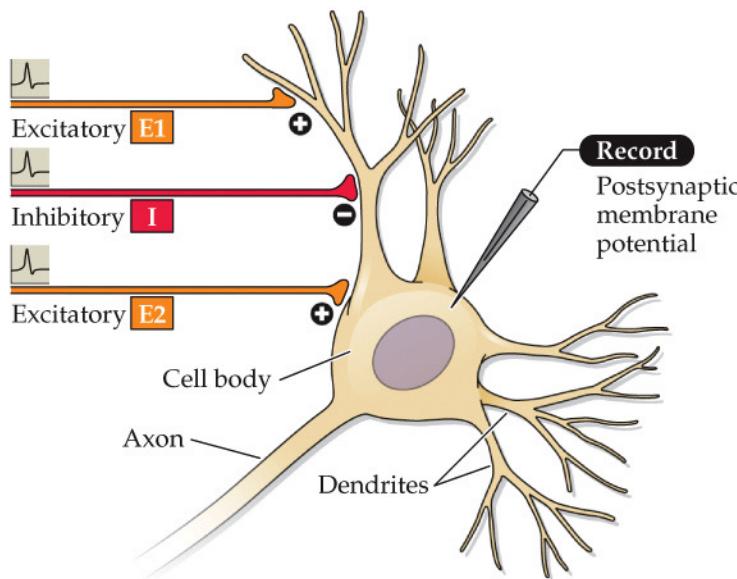

TABLE 6.2 ■ Endogenous Opioid Peptides

Name	Amino acid sequence ^a
Endorphins	
α -Endorphin	<i>Tyr-Gly-Gly-Phe-Met-Thr-Ser-Glu-Lys-</i> Ser-Gln-Thr-Pro-Leu-Val-Thr
α -Neoendorphin	<i>Tyr-Gly-Gly-Phe-Leu-Arg-Lys-Tyr-Pro-</i> Lys
β -Endorphin	<i>Tyr-Gly-Gly-Phe-Met-Thr-Ser-Glu-Lys-</i> Ser-Gln-Thr-Pro-Leu-Val-Thr-Leu- Phe-Lys-Asn-Ala-Ile-Val-Lys-Asn- Ala-His-Lys-Gly-Gln
γ -Endorphin	<i>Tyr-Gly-Gly-Phe-Met-Thr-Ser-Glu-Lys-</i> Ser-Gln-Thr-Pro-Leu-Val-Thr-Leu
Enkephalins	
Leu-enkephalin	<i>Tyr-Gly-Gly-Phe-Leu</i>
Met-enkephalin	<i>Tyr-Gly-Gly-Phe-Met</i>
Dynorphins	
Dynorphin A	<i>Tyr-Gly-Gly-Phe-Leu-Arg-Arg-Ile-Arg-</i> Pro-Lys-Leu-Lys-Trp-Asp-Asn-Gln
Dynorphin B	<i>Tyr-Gly-Gly-Phe-Leu-Arg-Arg-Gln-</i> Phe-Lys-Val-Val-Thr
